## 1. Introduction

Greater Hume Shire adopted its first roads strategy in 2012 with a requirement that it is updated every four years. The first update was in 2014 with this update being the third development of the strategy. This strategy update continues to enable better management of our roads, while still applying the basic principles detailed in the original document.

The original road register listed the roads as whole lengths but with some roads being a combination of sealed, unsealed and unformed sections this was not truly representative of our road system. Subsequently all the roads have now been broken into segments for classification.

We continue to improve the data of our roads system recorded in sections up to approximately 1000 metres long within our roads register and improve the accuracy by an ongoing process of developing condition reports, traffic counts, road usage, road widths and length, expected lives, construction and reseal dates.

A table showing all road classification changes since the last document can be found starting on page 10.

## 2. Revisions

To enable the management of roads now and the applicable designs of roads into the future we had allocated in the previous strategy Base Road Classes (based on usage, traffic score and location), and Maintenance Road Classes (based on the existing surface i.e. sealed or unsealed), highlighting the roads that will need to be re-designed at the end of their functional lives due to inappropriate sealing or changes of use.

In this version of the strategy we have reverted to the roads having one class only to simplify the classification of the road and its maintenance requirements. Separate tables in the document now indicate where a road has been classed at a higher (or lower) level than what the strategy formula has determined to highlight roads that need consideration for upgrading or have been constructed to a higher standard than required however now need the appropriate maintenance to maintain their integrity.

Under Road Classes, Council has a regional network of 284km and a local sealed rural road network of 673km supported by an unsealed rural road network of 1020km with 94km of sealed urban streets (excluding regional roads), and 16km of unsealed urban streets. Total 2071km.

As stated in the first strategy, a 1993 Australian Road Research Board report noted *"...a balanced road environment can only be achieved if the function of the road is matched with geometric design standards, which are in turn matched with construction standards, and the road is maintained to a standard which compliments the function, design and construction."* These standards however, need to be met within an achievable budget.

Total budget expenditure of Council funds on the local road network of 1,780km in 2015/16 is estimated as \$6,771,543. In addition, Council has a regional road network of 284km with a budget of \$3,589,972. The total expenditure on the road network represents 30.6 % of Council's annual expenditure (excluding depreciation and works on State Highways).

Because Council has a duty of care to road users, Council has reduced its exposure to a public liability claim by adopting standards for construction and maintenance, commensurate with its financial capacity. Council also has a statutory obligation to report on the condition of its road network as a component of Integrated Planning and Reporting. Council will adopt standards against which the current condition can be compared.

### 3. Road Hierarchy

Not all roads are constructed and maintained to the same standard. This is obvious with National Highways, State Highways and State and Regional roads, with a similar structure existing at the local level. Important local roads will link towns and villages and other local roads will provide access to individual properties or facilities. Important, high traffic volume local roads are usually sealed, whereas lesser roads may be unsealed; however other factors may override this generality.

### 4. Recommended Road Classes

| Road Standard                   |          | Class of Road |
|---------------------------------|----------|---------------|
| National Highway                | M Routes | 1             |
| State Highway                   | A Routes | 2             |
| Regional Road                   | B Routes | 3             |
| Sealed Local Road               |          | 4             |
| Unsealed Local Road             |          | 5             |
| Unsealed Single Lane Local Road |          | 6             |
| Formed Local Road               |          | 7             |
| Non Formed Access Easement      |          | 8             |

Several sources were used to evaluate the number of road classes to adopt for the road hierarchy. The adopted standards from a number of adjoining Councils including Junee, Tumut, Lockhart and Temora were reviewed but for consistency the classes used by GHD in their Road Condition Assessment report prepared for Council in 2010 have been continued. That report placed all sealed local roads in one class; class 4. It is felt that is a little simplistic and the hierarchy recommended splits class 4 into 4A and 4B.

Council's 284km of regional roads are all sealed and should be placed in a class between state roads and local roads. On the recommended hierarchy, they would all be class 3.

Factors considered in determining the class of local roads were:

- Traffic volume
- Heavy vehicle significance (B-Double Route)
- School bus route
- Special economic purpose
- Adjoining land use (primary access to dwellings)

Road classes were determined by listing all local roads with known and assumed data and used this data to calculate a "traffic score". This traffic score was used to allocate each road to a class. The above factors are used with traffic volume being increased by 30% if the road is a school bus route, (50% if used by two buses) and a further 50% if a B-Double route. A special economic purpose, for example timber haulage, which is often associated with some external funding, may cause an adjustment to the calculated road class.

Sealed Urban roads are class 4A roads, and as we have Unsealed Urban Roads that are not recommended to be sealed they are included as class 5 roads. All sealed Local Rural Roads that have a traffic score of over 200 are classified as class 4A roads with class 4B roads having a traffic score of 80 to 200.

All Unsealed Rural Roads class 5, have a traffic score of 40 to 80 or service 5 or more Dwellings and class 6, a traffic score of 10 to 40 or service 1 to 4 dwellings with class 7 (formation only), a traffic score of less than 10. Class 7 roads are dry weather farm access only and do not provide primary access to dwellings. Class 8 roads are non-formed access easements that have limited access and Council does not maintain them.

As traffic counts are not available for the bulk of low traffic roads, traffic volumes and thus traffic score must be estimated and the number of dwellings serviced being the main priority to determine class of road.

This is tabulated below.

| Calculated Traffic Score | Dwellings Serviced | Class of Road      |
|--------------------------|--------------------|--------------------|
| >200                     | N/A                | 4A                 |
| 80 - 200                 | N/A                | 4B                 |
| 40 - 80                  | ≥5                 | 5                  |
| 10 - 40                  | 1 - 4              | 6                  |
| <10                      | 0                  | 7 (Formation Only) |
| 0                        | 0                  | 8                  |

Many of Council's gravel roads service one or two dwellings and these dwellings often have alternate means of access. It is necessary on occasion to nominate the shortest or most used road as class 6 and alternates as class 7.

Class 4 roads are sealed; with lower classes mainly gravel pavements or formation only. Some roads may have been sealed previously and have a lower traffic score, and these sealed areas will be maintained unless determined otherwise by Council resolution. As discussed below there may be specific reasons why a low traffic road has or would be provided with a sealed surface. There are roads in the shire which have a sealed surface, 'generally a narrow 3.6m wide seal' that does not fit into the class 4 category, these will have the surface and shoulders maintained to an affordable standard.

Adjoining land use such as residential, rural residential and industrial development will cause a demand for sealing of the road pavement. Thus, all roads serving these intense land uses are classified as at least class 4B, irrespective of the calculated traffic score.

Some roads may be considered "strategic" even though they carry low traffic volumes. Examples are roads linking villages, or heavy haulage routes.

As part of the development of this strategy there has been a Class 4C included in this draft to enable management of the Dust and Floodway Seals that are included on some unsealed roads that deal with specific problems unique to that location. These seals total 15.05km of road length.

## 5. Road Design Parameters

The class of a road determines the standard to which it is designed, constructed and maintained. Higher design standards add significantly to construction costs.

Design elements for roads include:

- Pavement strength (depth and structure)
- Design speed (horizontal and vertical curves, sight distance)
- Culvert and bridge size
- Lane width and number of lanes
- Line marking
- Guardrail, Guide posts and signage
- Clear zones
- Shoulder width and treatment
- Drainage design

Design standards recommended for adoption are summarised in Table 1. Width of seal for class 4A of 8 metres and 4B roads are a minimum of 7m as lesser widths invariably lead to high maintenance costs and unsafe conditions. Most other standards for construction and maintenance vary between class 4A and 4B. Thus, 4B roads will be cheaper to construct and maintain commensurate with their lesser importance and usage.

These design standards reflect community expectation of a modern road network and provide the potential for reduced maintenance and liability costs due to less edge wear, flood damage and minimal unexpected changes in road standard.

A standard cannot be assigned to Class 4C seals as each individual case requires to be designed to solve the specific problem at that location.

## 6. Urban Streets

All urban streets are classified as class 4A (for sealed roads) or 5 (for unsealed roads) due to the nature of adjoining development.

## 7. Summary of Upgrading Class 3 to 7 Roads to Meet Required Standards

For the purposes of this report roads within 0.5m of the required width are deemed to meet the standard and are therefore nominated as compliant. The table below (based on the current data we have), provides the estimated cost to upgrade Class 3 and 4 roads to 8m and 7m wide seal in accordance with the recommended design parameters. Of the 284km of class 3 road, 160km or 56.2% is currently 7.5m or more in width. Of the 759km of sealed rural class 4 local road 294km or 38.8% is currently less than 7m in width.

There are 24.8km of class 4 roads that are unsealed with an estimate of \$5M to reconstruct as class 4 standard roads.

The unsealed class 5 and 6 roads will be brought to the correct width when they are re-sheeted and the maintenance grading of class 7 roads will bring them to the correct width.

| Class            | Sealed length Km | Unsealed Length km | Cost to upgrade widths to Standard \$Million |               |              |
|------------------|------------------|--------------------|--|---------------|--------------|
|                  |                  |                    | Length                                       | Rate          | Total        |
| 3                | 284              | 0                  | 124km  | @\$250,000/km | \$31M        |
| 4                | 742              | 0                  | 294km  | @\$200,000/km | \$59M        |
| Unsealed Class 4 | 0                | 25                 | 25km   | @\$200,000/km | \$5M         |
| 5                | 0                | 291                | N/A  | N/A           | 0            |
| 6                | 0                | 631                | N/A  | N/A           | 0            |
| 7                | 0                | 98                 | N/A  | N/A           | N/A          |
| <b>Total</b>     |                  |                    |  |               | <b>\$95M</b> |

The non-compliance of the network should be viewed as much due to improving standards rather than chronic underinvestment.

## 8. Maintenance Standards and Response Times

The benefits of high construction standards are quickly eroded if they are not supported by equivalent maintenance standards. For example, culverts designed for a 1 in 20-year event need to be kept clear to perform at that level. Similarly, some design elements will have higher safety significance and thus deficiencies will need to be addressed more promptly. For example, wheel path potholes or missing warning signs should be fixed or replaced in a very short time, whereas a missing guidepost would not warrant the same urgency.

## 9. Maintenance of the Sealed Road Network

### Resealing of Bitumen Surfaces

The total length of bitumen seal on local roads and streets is approximately 767km. Based on an accepted engineering standard useful life of 20 years Council should complete the annual resealing of approximately 38.4km at an estimated cost of \$1.15M. In addition, 14.2km of Regional Road should be resealed each year at an estimated cost of \$0.578M.

| Resealing             | Km Per Year | \$ Per Km | Required \$M Annually | Current Budget \$M Annually |
|-----------------------|-------------|-----------|-----------------------|-----------------------------|
| Regional Roads        | 284/20=14.2 | 40,000    | 0.57                  | 0.6                         |
| Local Roads & Streets | 767/20=38.4 | 30,000    | 1.15                  | 1.1                         |

### Reconstruction of Sealed Roads

Based on a useful life of 100 years Council should be reconstructing 7.6 km of sealed local road and streets annually. The estimated cost of this reconstruction is \$1.5M. Similarly, based on a useful life of 85 years, 3.34 km of Regional Road should be reconstructed annually at a cost of \$0.84M.

| Reconstruction | Km Per Year  | \$ Per Km | Required \$M Annually | Current Budget \$M Annually |
|----------------|--------------|-----------|-----------------------|-----------------------------|
| Regional Roads | 284/85=3.34  | 250,000   | 0.84                  | 1.01                        |
| Local Roads    | 673/100=6.73 | 200,000   | 1.35                  | 1.85                        |
| Urban Streets  | 94/100=0.94  | 200,000   | 0.19                  | 0.5                         |

## 10. Maintenance of the Gravel Road Network

### Re-sheeting Gravel Roads

The AARB Manual (Ref 2) provides a complex formula for the calculation of annual gravel loss on unsealed roads. Inputs to the formula include traffic volume, road gradient, gravel type and annual rainfall. Applying this formula for class 6 roads we average 16 vehicles per day, calculates annual gravel loss as 5mm and our class 5 roads average 40 vehicles per day gives an annual loss of 10mm. Using resheet thickness of 100mm means a recurrence interval of 20 and 10 years respectively. The cost of resheeting Council's class 5 and 6 roads can be tabulated as follows:

| Local Road Class | Unsealed Length Km | Resheeting Frequency Years | Annual Length Km | Unit Cost/ Km \$ | Annual Cost \$M | Current Budget \$M |
|------------------|--------------------|----------------------------|------------------|------------------|-----------------|--------------------|
| 5                | 291                | 10                         | 29.1             | 50,000           | 1.45            |                    |
| 6                | 631                | 20                         | 32               | 30,000           | 0.96            |                    |
| <b>Total</b>     |                    |                            |                  |                  | <b>2.41</b>     | <b>0.992</b>       |

### Maintenance Grading of Gravel Roads

Fossberg et al (Ref 1) note that studies undertaken over several years indicate an optimum grading frequency of each 4,000 to 8,000 vehicles. For an unsealed road carrying 20 vehicles per day this would indicate a regrading of 6 months to annual frequency. Using the longest frequency means class 5 roads should be regraded 6 monthly, class 6 annually and class 7 every two years. This cost is tabulated as follows:

| Class of Road | Unsealed Length Km | Frequency     | Annual Grading Length Km | Cost/ Km \$ | Annual Cost \$   | Current Budget \$M |
|---------------|--------------------|---------------|--------------------------|-------------|------------------|--------------------|
| 5             | 291                | Twice a Year  | 582                      | 1000        | 582,000          |                    |
| 6             | 631                | Each Year     | 631                      | 800         | 504,800          |                    |
| 7             | 98                 | Every 2 Years | 49                       | 600         | 29,400           |                    |
| <b>Totals</b> | <b>1020</b>        |               | <b>1262</b>              |             | <b>1,116,200</b> | <b>1,051,000</b>   |

## 11. Record Keeping

Council needs to keep accurate up to date records of road maintenance, when road defects are identified (or notified by others), and when they are corrected, to be able to defend Public Liability claims. Achieving the standards is not sufficient, as courts will require documented evidence.

Council has relied on time sheets and diaries for this in the past and is now developing a proprietary system (Reflect) to supplement this requirement across its local and regional roads.

## 12. Bitumen Sealing of Lower Class Roads

There are several factors other than traffic volumes which may result in a need and decision to seal roads which do not fit class 4.

Council often receives requests to provide "dust seals" on rural roads in proximity to rural dwelling or facilities. Some of the former Councils had policies and programs for this type of work in their budgets. This type of work removes a nuisance rather than improves the road network.

All roads in rural residential environments should be sealed for the same reasoning as the provision of “dust seals”.

Some road sections warrant sealing due to steep or difficult terrain. These sections are either very expensive to maintain as a gravel surface or may be dangerous or impassable during wet weather. An example of this was the steep section of Four Mile Lane sealed in 2006.

All sealed road sections will be classified as class 4 in the Road Class and will only be re-classified if the seal is removed.

### **13. Bridges**

This report does not include an analysis of Council’s bridges. Generally, these assets are in good condition with most having no load limits and all but one being of concrete construction.

### **14. Data Accuracy**

This report and the accompanying tables were developed from the large volumes of data in Councils finance and asset databases, which is used for analysis of Council’s expenditure needs in road maintenance. Due to ongoing subdivision works the length of road for which Council is responsible continues to increase. Whilst the accuracy of the data will continue to be improved, any errors and omissions in this report are likely to have a minimal effect on the estimates provided. Of far greater importance is the unknown future cost of inputs such as pavement materials and bitumen, which is tied to oil prices and availability.

### **15. Discussion**

The Hierarchal Strategy provides Council with an overall direction with regard to the priority of what roads, and to what standard, roads are to be built and maintained in the future.

The current state of the road network may require that some lesser priority roads in poor condition will be attended to before higher priority roads as Council cannot afford to have any parts of the road network deteriorate to an unsafe or unmaintainable state. It should be noted that it is proposed that roads will only be constructed to the standards as detailed in the strategy, unless a separate approval is given by Council resolution.

This initial strategy will empower the mitigation process to prevent the overall state of the network falling into disrepair by ensuring that roads are only constructed to a standard that is associated with their use and will minimize future maintenance costs.

The following Points should be noted by Council:

- The cost to upgrade to standard is based upon the design standards outlined in Table 1 and it is unrealistic to expect that Council will ever have all roads constructed to this standard. It does however clarify construction standards from this Point on.
- An incremental approach will need to be taken to increasing local road reconstruction, resealing and gravel resheeting expenditure budget over an extended period of time.
- Future budgets will need to provide adequate maintenance budget for the sealed and unsealed network.

### **16. Recommendation**

That;

- The road hierarchy be confirmed
- The emphasis for expenditure of available funds be on the upgrading of the existing assets over new construction
- The Director Engineering prepares a 10 year plan for road improvements based on the existing revenue streams.

### Code Classification

| Code      |   |
|-----------|---|
| <b>1</b>  | Unsealed roads are class 5 and below, sealed roads are 4 and above.   |
| <b>2</b>  | Minor adjustment to asset management system in order to simplify records. This can include the combining of undersized segments, renumbering segments to suit road direction or removal of unnecessary sections (such as unconstructed segments). |
| <b>3</b>  | This segment has already been constructed but has recently been renamed.  |
| <b>4</b>  | This road did not exist at the time of the previous strategy.   |
| <b>5</b>  | Road existed at the time of previous strategy but was not recognised and was unnamed.   |
| <b>6</b>  | A new class has been created to manage dust sealed sections on otherwise unsealed roads.  |
| <b>7</b>  | This segment has been created due to the alteration of the other segments to allow for the new 4C (dust seal) classification.   |
| <b>8</b>  | A segment of this road has been identified as Non Formed Access Easement since last strategy. It has been downgraded or deleted as a result.  |
| <b>9</b>  | Road has been downgraded to a more appropriate classification. It may have been incorrectly estimated in the previous strategy.   |
| <b>10</b> | Class 5 and 6 roads are gravelled, class 7 roads are formed but have no gravelled surface. This segment may have been incorrectly recorded in the previous strategy.  |
| <b>11</b> | Road does not meet criteria for current classification and has been moved up or down a class to suit.   |
| <b>12</b> | Road has more or less residential property access (and therefore use) than previously estimated   |
| <b>13</b> | Road constructed to a higher standard than necessary (e.g. Bowna Road was once the Highway) and that level of maintenance is no longer required.  |
